

Data Layer for Enterprise AI

AI fails when the data layer can't deliver.

Analytics Era Infrastructure Was Not Built for Agents.

Dashboards needed data. Agents need data, context, action, and governance. The ETL, ELT, and iPaaS tools built since the 1980s were designed for humans. They move data to analysts, not context to agents.

Connectivity

Enterprise systems require schema awareness, auth, retries, and bidirectional sync.

Fragmentation

Agents must work across SaaS apps, warehouses, streams, and legacy systems.

Missing Semantics

Access to a table tells agents nothing. Without metadata, lineage, and policy, agents hallucinate.

Governance

Raw MCP access into databases means no identity mapping, no audit trail, no PII protection.

Access. Understand. Deliver.

One fabric for agents and pipelines. Three layers that connect to anything, enrich it with context, and deliver it through every integration pattern agents need.

LAYER 1: Access Anything

1000+ bidirectional connectors for enterprise systems: SaaS, databases, streams, files, APIs, and legacy. AI connector builder ships new connectors in under a week. Deep object coverage, custom objects, secure tunneling, VPC.

LAYER 2: Understand Everything

Raw data is not context. Helix is Nexla's context engine. It unifies Nexsets (governed data products with schema, semantics, lineage, and policy), enterprise documents, and pipeline history into a unified Knowledge Graph and Vector DB.

LAYER 3: Deliver Everywhere

MCP Studio, Agent Data SDK, Agentic RAG, ETL and ELT pipelines, Streaming, CDC, and a real-time Data API. One platform, every integration pattern. Build once, serve every data consumer.

Discover What's Worth Connecting, Automatically

Most data tools require pipelines before you know if the data is useful. Agentic Probe flips that, it autonomously explores your connectors, scanning databases, file systems, and APIs to identify high-value data ready to become MCP tools. No pipeline required.

The Context Layer Built for Agents

Agents hallucinate when they lack context. Helix eliminates that. Helix ingests enterprise documents, Nexset metadata, system schemas, pipeline history, and web content into a unified Knowledge Graph and Vector DB, grounding every agent interaction.

INTRODUCING MCP Studio

MCP Studio turns a business problem description into a governed MCP server, no integration code required. Describe what your agents need to do, and it probes connected systems, discovers the right data, and builds and secures the server for you.

How It Works

- 1 Describe your purpose
- 2 Select your systems
- 3 Nexla probes & discovers
- 4 Tools and server assembled
- 5 Governance & security enforced

Works with Claude, ChatGPT, Gemini, Microsoft Copilot, and any MCP client.

● MCP Studio (Early Access) nexla.com/mcp-studio

GET STARTED WITH Express

Agentic Data Integration

Describe a pipeline or MCP server in plain English, Express builds and manages it, agents keep it running after.

How It Works

"Connect Salesforce to Snowflake, sync accounts daily" →

Pipeline generated in minutes vs. 3 weeks traditional

POC in minutes,
production in 1–8 weeks depending on complexity

● Try express.dev

Agentic Use Cases. Real Enterprise Impact.

Real enterprises across every industry are using Nexla to drive measurable impact across customer experiences, operational efficiency, and intelligent analysis.

AI-Powered Customer Experiences

Unify structured and unstructured data for RAG powered search, recommendations, and personalized experiences.

Document Processing Automation

Transform PDFs, forms, emails, and scanned documents into structured data for agentic workflows. Speed processing and reduce manual errors.

Financial Analysis

Combine real-time market data, SEC filings, and internal databases for agentic retrieval across structured and unstructured sources.

Enterprise Knowledge Assistant

Build enterprise AI assistants with multi source retrieval across documents, emails, databases, and PDFs for accurate answers at scale.

Proven at Scale.
